3D Modeling for Visual Analyses of Recent and Historical Weather and Ground Water Patterns

Reuben Reyes[1] and **Jad R. Ziolkowska**[2]

University of Oklahoma

[1] Oklahoma Climatological Survey, Oklahoma Mesonet
[2] Dept. of Geography and Environmental Sustainability

Examples

- Radar rainfall estimates in Oklahoma from 2014 and 2015
  - 3D printed models
  - VRML for VR

- Visual representation of ground water levels in Oklahoma & Texas
  - Data sets in KML
  - Uses in Virtual Globes or GIS
  - Online interactive web using CesiumJS

- Tornado totals by county in Oklahoma from 1950 to 2017
 - 3D printed models
  - KML and CesiumJS

Radar rainfall estimates in Oklahoma

- NWS Arkansas-Red Basin River Forecast Center or ABRFC
  - Data as netCDF at one hour intervals
  - Each 1 hour data set was added into a new netCDF for year totals
- 3D surface using Z as rainfall totals
  - netCDF was converted to a surface (Lat, Long, and Z as rainfall totals)
  - Masked only state of Oklahoma and added sides and bottom
- Check for errors on STL
  - Used ADMesh for error checking for holes or inverted facets
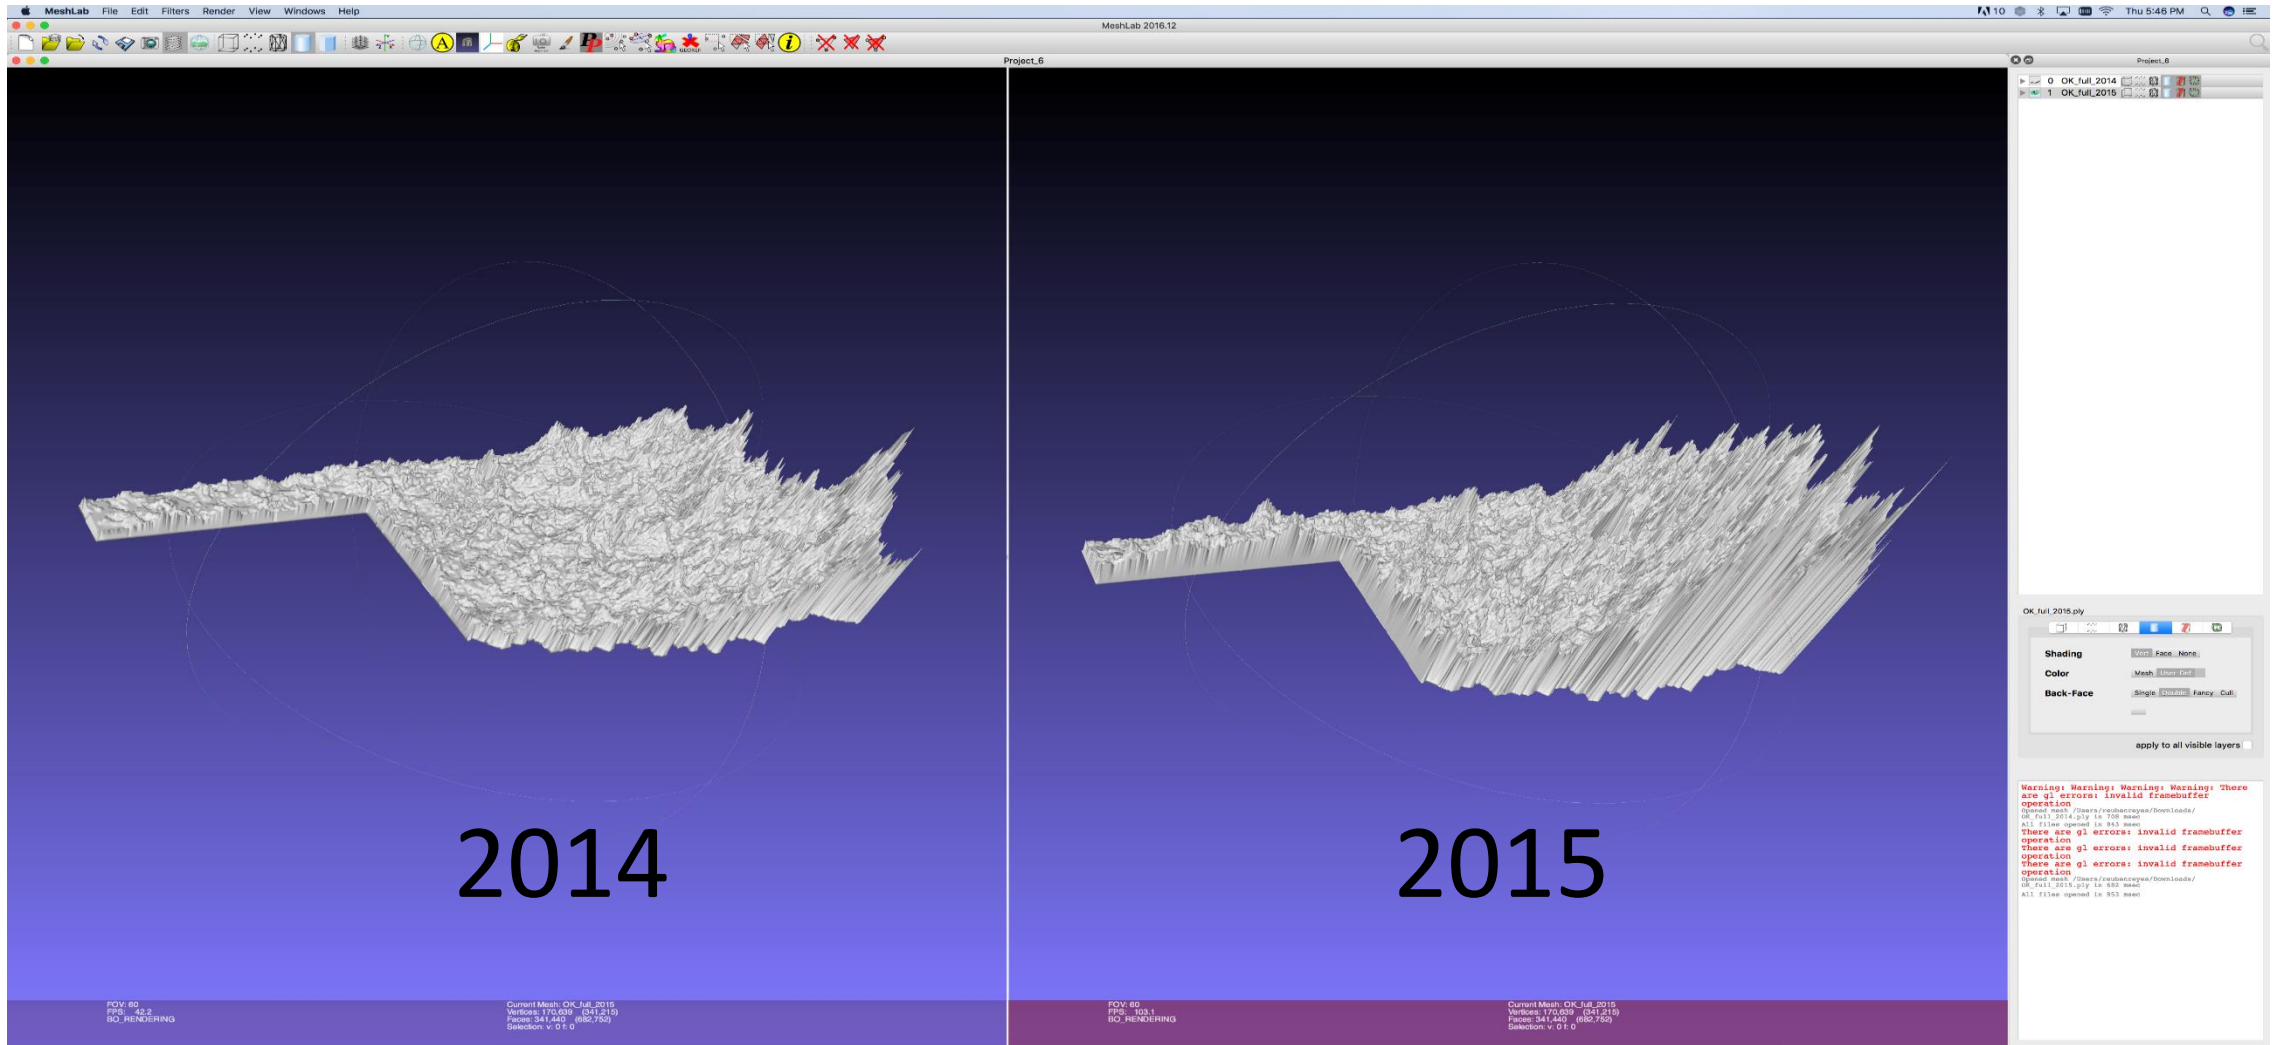

Rainfall totals in 2D

Digital STL display

2014

2015

Printed 3D models

VRML format for Virtual Reality

2014

2015

Ground water levels in Oklahoma & Texas

- Subset of 4 year interval sections
  - 2003-2006, 2007-2010, 2011-2014

- Values for each well are normalized statistically

- Visualization in KML/KMZ for use in virtual globes
  - Google Earth and Google Earth Pro
  - NASA World Wind, ArcGIS Explorer, ArcGIS Earth, and

- Used VSL in both Oklahoma and Texas data sets

- Interactive web using Cesium JS
 - Viewable in any modern browser

Visual Shape Logic

**discernible decrease**

**discernible increase**

no discernible change

2011-2014
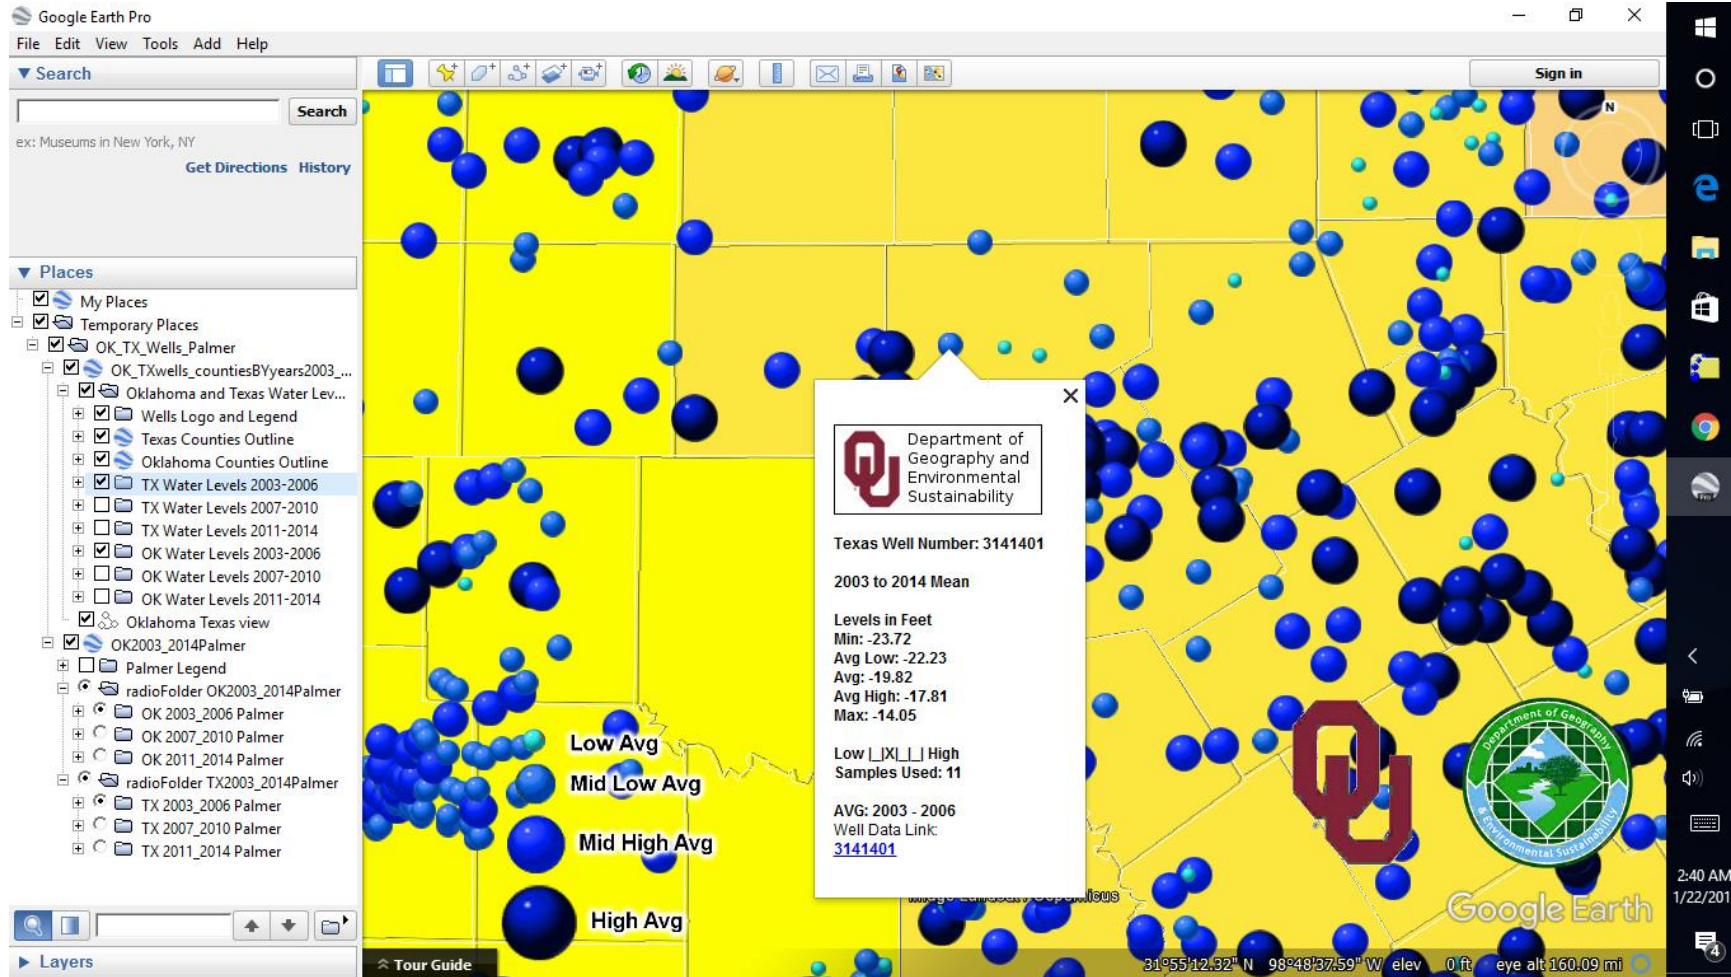

2007-2010

2003-2006

Examples in West Texas

Example views in Oklahoma and Texas

Interactive query of each data point

Tornado totals by county in Oklahoma

- County shape files were converted to KML

- Data from NWS Tornado totals for Oklahoma from 1950 to 2017

- Displayed in 2D

- Extruded county height to match Tornado totals

- Converted to STL for 3D printing

- Added 2 other data sets Area Index and Wind Area Index

- Merged all 3 data sets into KML

- Web access using CesiumJS

Formulas for Oklahoma Counties

$N = \{n_1, n_2, \dots n_i, \dots n_{77}\};$

n_i = # of tornadoes in i^{th} county from 1950 to 2017

$N_{per\ area} \cdot scalar1$

$N_{per\ area} = \{\frac{n_1}{S_1}, \frac{n_2}{S_2}, \dots \frac{n_i}{S_i}, \dots \frac{n_{77}}{S_{77}}\};$

S_i = area of ith county

$scalar1 = max(N_{per\ area})$
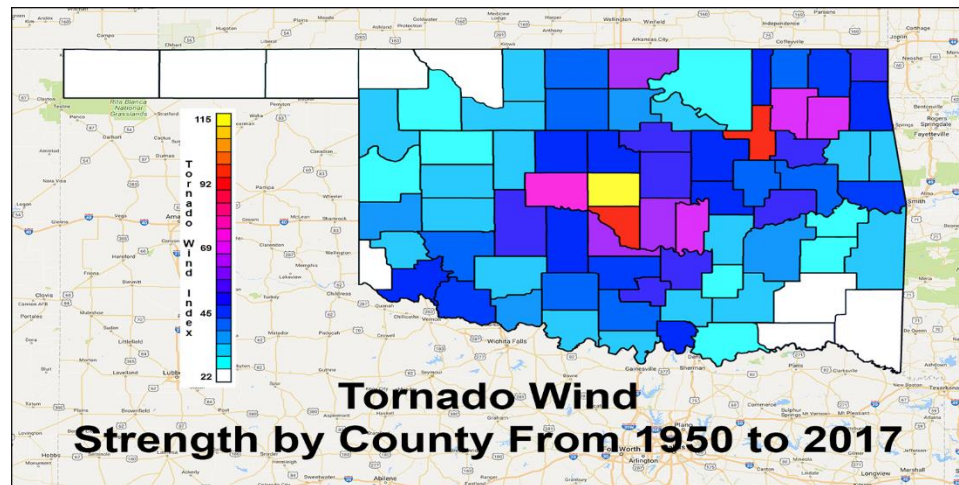

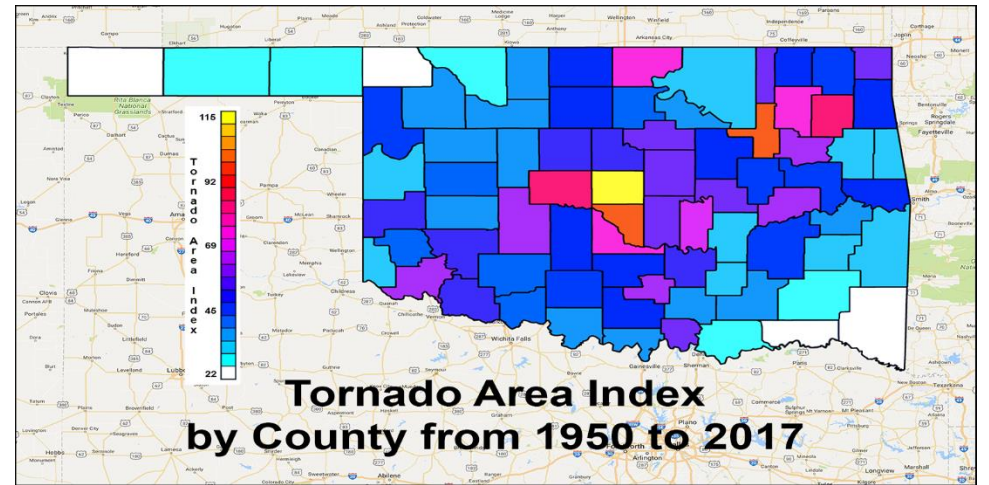

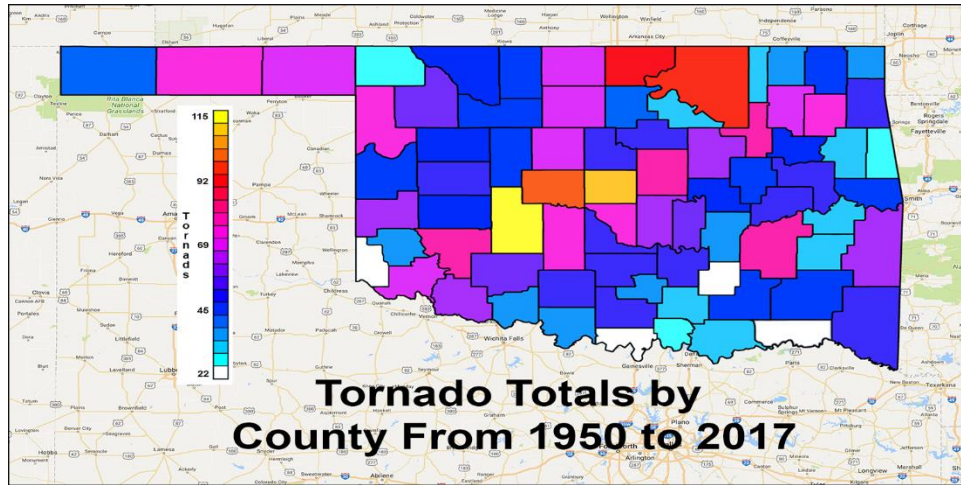

$P \cdot scalar2$

$P = \{\frac{\sum_{k=1}^{n_1} v_{1k}}{S_1}, \frac{\sum_{k=1}^{n_2} v_{2k}}{S_2}, \dots \frac{\sum_{k=1}^{n_i} v_{ik}}{S_i}, \dots \frac{\sum_{k=1}^{n_{77}} v_{77k}}{S_{77}}\};$

v_{ik} = wind speed of kth tornado in i^{th} county

$scalar2 = max(P)$

2D examples of Oklahoma Tornadoes

Tornado Totals by
County From 1950 to 2017

Tornado Area Index
by County from 1950 to 2017

Tornado Wind
Strength by County From 1950 to 2017
Extruded counties into 3D

Tornado Totals by
County 1950 - 2017

Tornado Area Index
By County 1950 - 2017

Tornado Wind Index 1950 - 2017

Converted to STL for 3D printing
